AMENDMENTS TO THE CLAIMS**BEST AVAILABLE COPY**

1-10. (Canceled)

11. (Original) A logic circuit comprising:

a first transistor;

a second transistor that is arranged to operate as a cascode transistor in cooperation with the first transistor, wherein the second transistor includes:

a gate that is coupled to a bias node,

a drain that is coupled to a first output node, and

a source that is coupled to a second output node;

a third transistor;

a fourth transistor that is arranged to operate as a cascode transistor in cooperation with the third transistor, wherein the fourth transistor includes:

a gate that is coupled to the bias node,

a drain that is coupled to a first complement output node, and

a source that is coupled to a second complement output node,

a first keeper switch circuit that is coupled to the bias node, the second complement output node, and the second output node, and

a second keeper switch circuit that is coupled to the bias node, second output node, and the second complement output node.

12. (Original) The logic circuit of Claim 11, wherein

the second transistor is configured to receive a first cascode bias voltage at the bias node, wherein

the first cascode bias voltage is suitable for biasing a cascode transistor.

13. (Original) The logic circuit of Claim 11, wherein

the first keeper switch circuit is configured to influence a resistance between the second output node and the bias node in response to a control signal.

Application No. 10/724,028
Amendment dated December 15, 2005
After Final Office Action of October 26, 2005

Docket No.: 08211/0200253-USO (P05742)

-3-

14. (Original) The logic circuit of Claim 11, wherein
the first keeper switch circuit is configured to:
receive a control signal at the second complement output node;
couple the second output node to the bias node if the control signal
corresponds to a first logic level; and
isolate the second output node from the bias node if the control signal
corresponds to a second logic level.

15. (Original) The logic circuit of Claim 11, wherein
the logic circuit is arranged to operate as a level shifter circuit.

16. (Previously Presented) The logic circuit of Claim 11, wherein
the first keeper switch circuit comprises a keeper transistor including:
a gate that is coupled to the second complement output node,
a source that is coupled to one of a group consisting of the second output
node and the bias node, and
a drain that is coupled to the other of the group consisting of the second
output node and the bias node.

17. (Previously Presented) The logic circuit of Claim 16, wherein
the second transistor is one of a group consisting of an n-type transistor and a p-type
transistor, and the keeper transistor is the other of the group consisting of the n-type transistor and
the p-type transistor.

18. (Previously Presented) The logic circuit of Claim 11, wherein
the second keeper switch circuit comprises a fifth transistor including:
a gate that is coupled to the second output node,

After Final Office Action of October 26, 2005

a source that is coupled to one of a group consisting of the second complement output node and the bias node, and

a drain that is coupled to the other of the group consisting of the second complement output node and the bias node.

19. (Previously Presented) The logic circuit as in Claim 18, wherein the first keeper switch circuit comprises a keeper transistor, and wherein the second transistor is one of a group consisting of an n-type transistor and a p-type transistor, the keeper transistor is the other of the group consisting of the n-type transistor and the p-type transistor, and the fifth transistor is the other of the n-type transistor and the p-type transistor.
